

FIS & Forest Fire Management

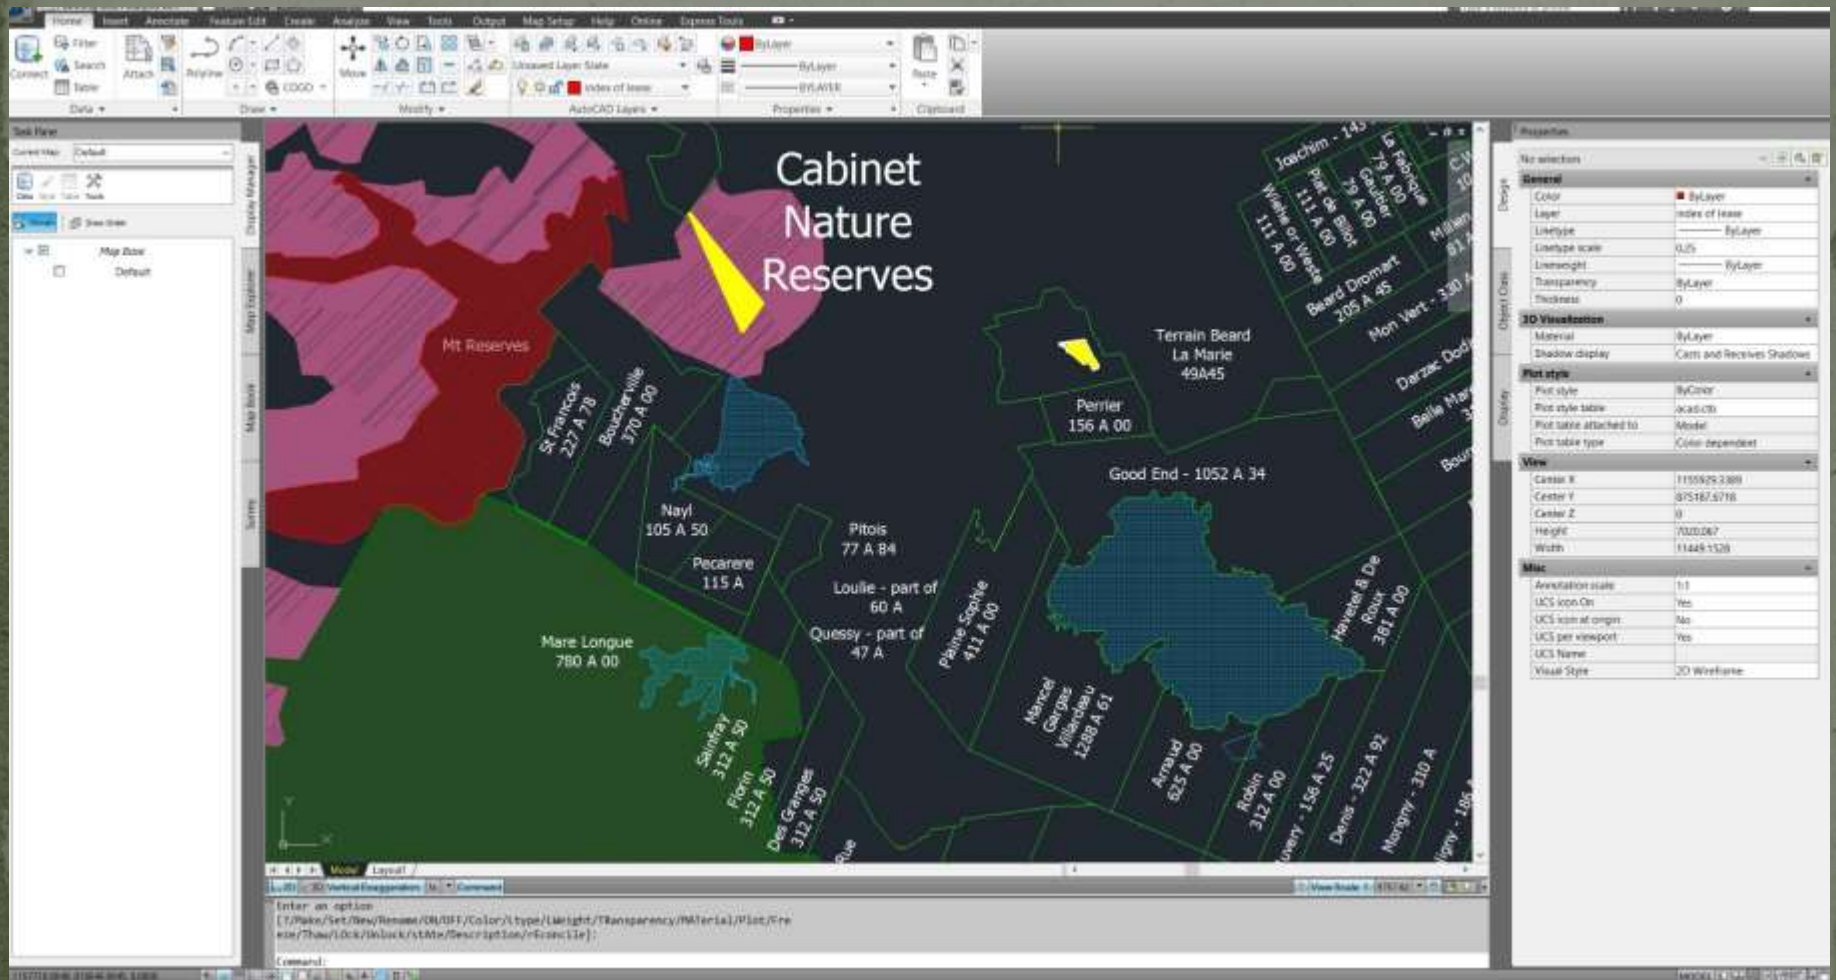

Forestry Service
Ministry of Agro Industry and Food Security

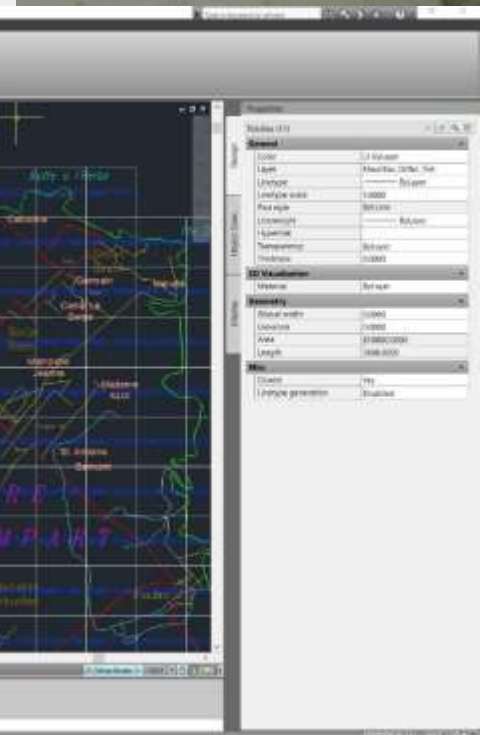

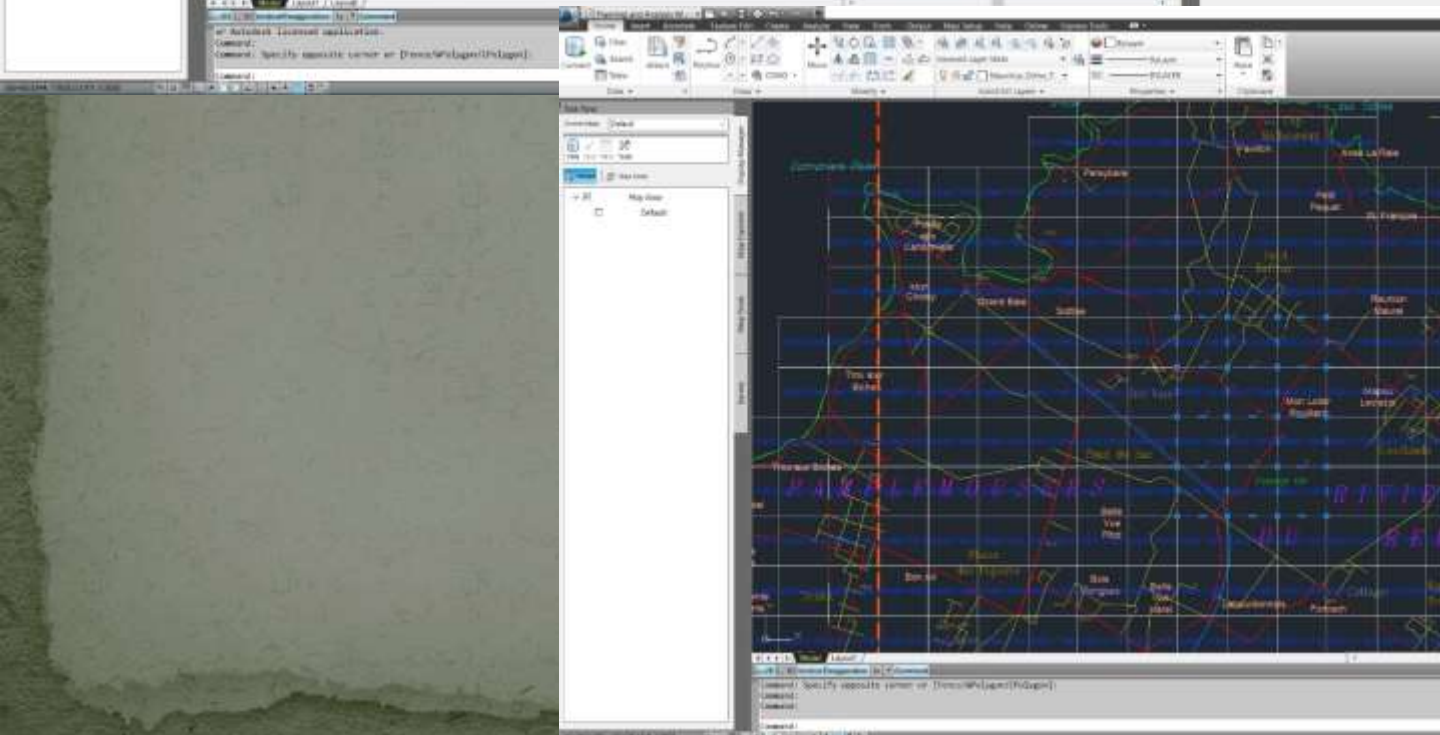

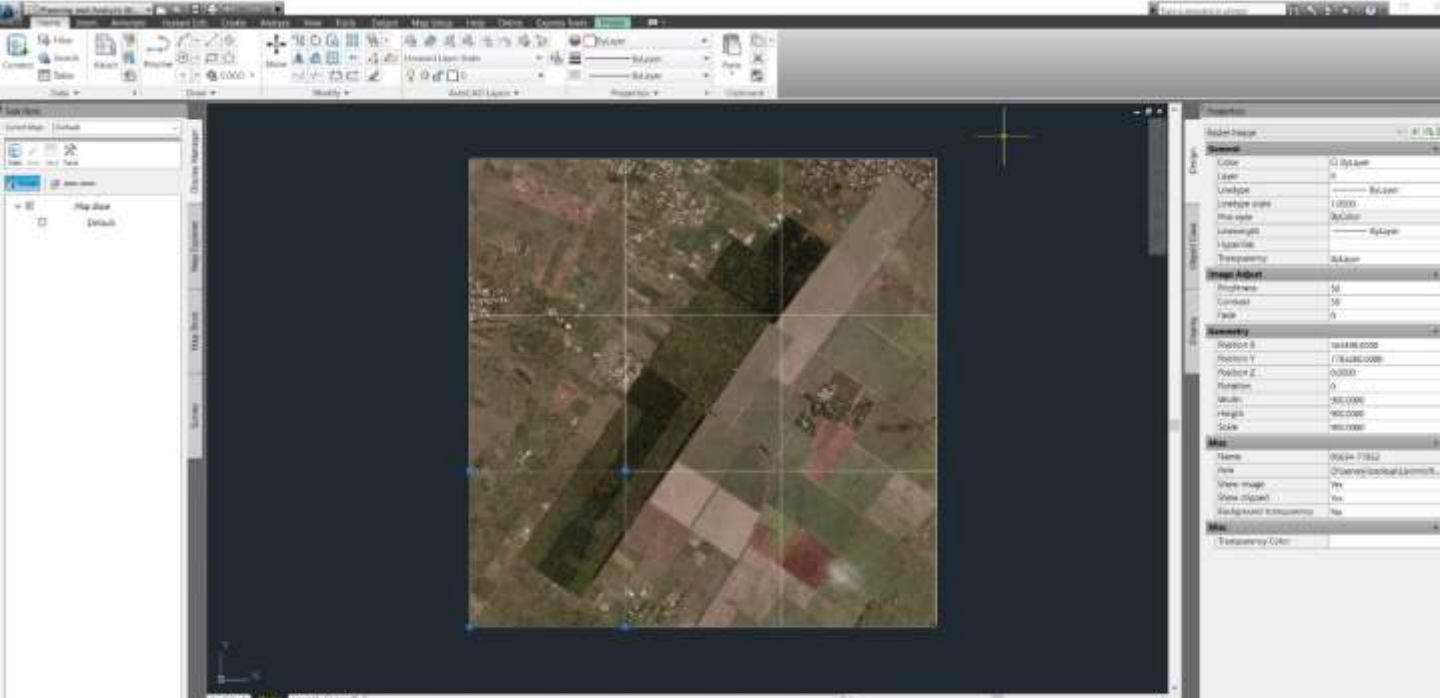

Current Situation

- No complete Forest Information System
- More than 50% of the forests in Mauritius are privately
Forest Reserve Act of 1983 does not make provision for the protection of private forest land outside of Mountain Reserves, River Reserves and Road Reserves
- The last inventory of private forests dates back to 2006.
- Current system of the Forestry Service for mapping purpose are: AutoCAD Map 3D 2012 and AutoCAD 2015.
- Forestry data are collected in Excel workbook and in Record book

Current system AutoCAD

Forest Data collected in Excel Workbook

List of Pine Plantations [Compatibility Mode] - Excel

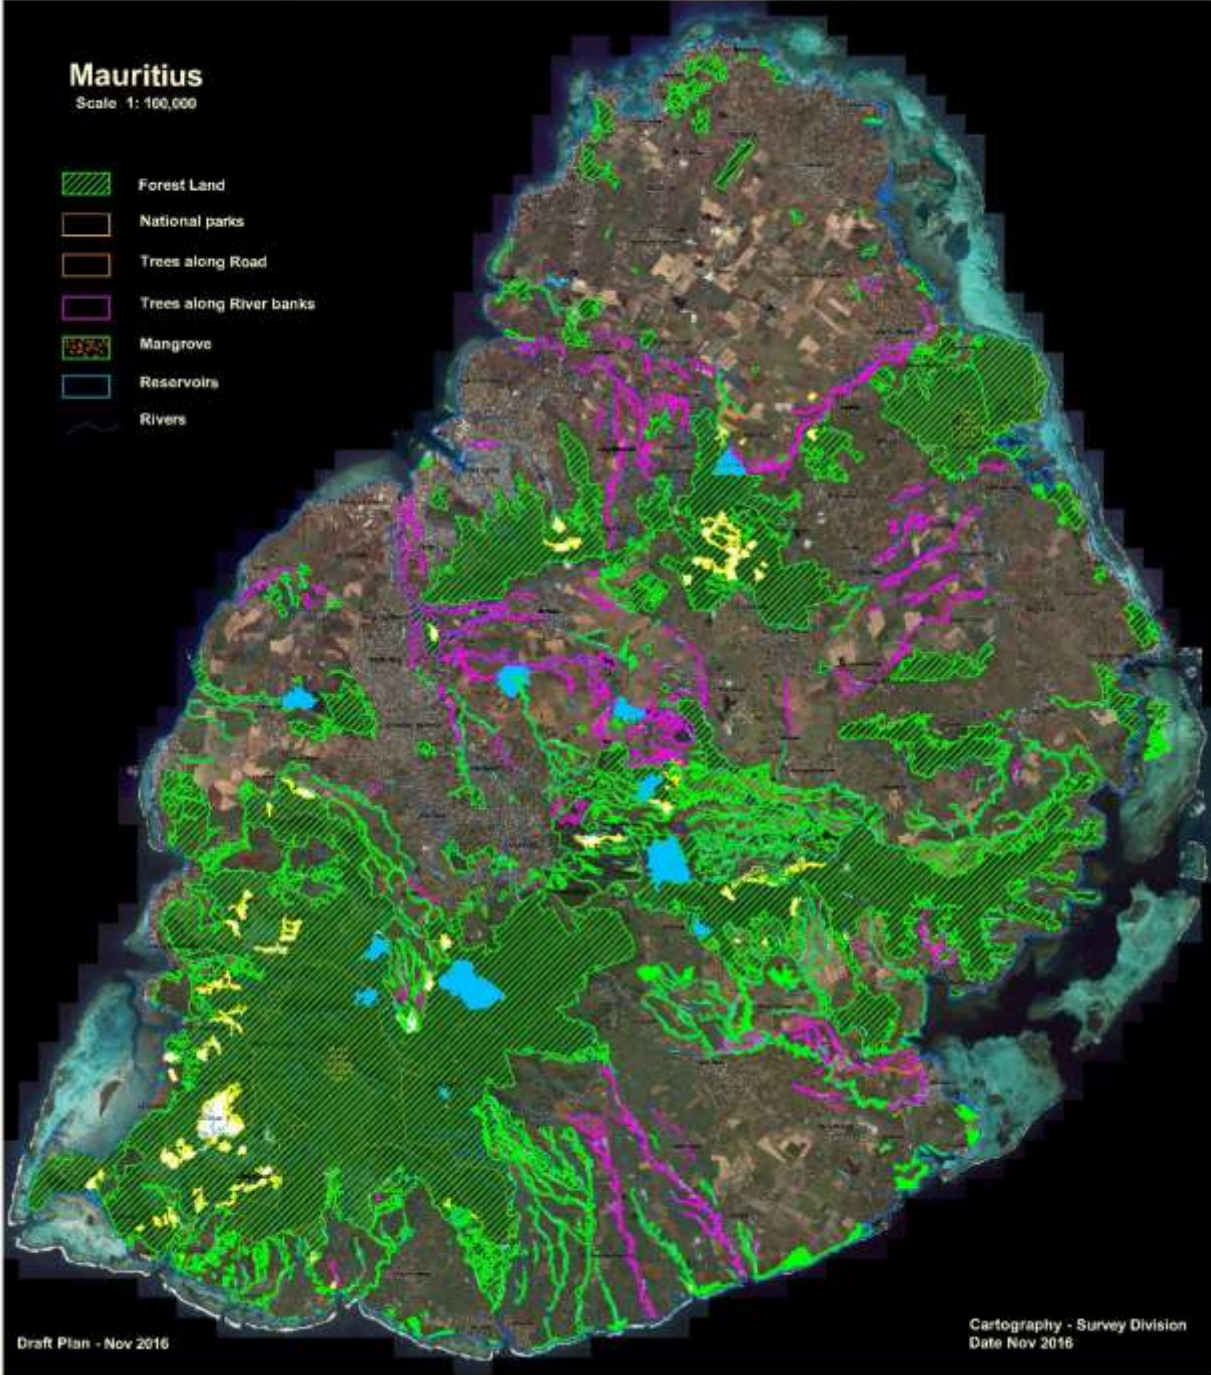

Pine Plantations						
SOUTHERN DIVISION						
TOTAL	4935.56	Ha				TOTAL AREA UNDER PINE PLANTATION,AS PREDOMINANT SPECIES

Difficulty update Changes in Forest Land Cover

	Area (hectares)		% of total land area	
	2007	2016	2007	2016
Forests lands : of which	47,176	47,066	25.3	25.2
State owned	22,176	22,066	11.9	11.8
Plantations	11,878	11,798	6.4	6.3
Land Protected areas and Nature reserves	8,254	8,374	4.4	4.5
Other Forest Land	1,413	1,271	0.8	0.7
Pas Geometriques	631	623	0.3	0.3
Privately owned lands ¹	25,000	25,000	13.4	13.4
Reserves (land protected areas)	6,540	6,540	3.5	3.5
Other	18,460	18,460	9.9	9.9

¹ include plantations, reserves, scrub and grazing lands.

Current Forest data are not linked with Map and makes the process of updating changes in forest cover very tedious

Forest Land Information System (FLIS)

- Previous attempt to create a Forest Information SystemGIS for forest land in Mauritius started in 2006.
- Platform –ArcGIS (ESRI)

Acquisition of satellite imagery and aerial photography

- SPOT (5m) - 2006
- Quickbird (60 cm) - 2006
- Acquired ortho-rectified aerial imagery from LAVIMS Project -Digital aerial imagery for the whole island (15 cm digital aerial imagery) – 2008 (Very Expensive)

Why the previous FIS could not be sustained?

Prohibitive cost:

- Acquisition of high resolution satellite imagery and aerial photography.
- Renewal GIS license.
- Backup hardware – large storage capacity hard drive for storage of satellite imagery and aerial photographs was expensive in 2006.

Hardware Failure:

- Computer System fried during electrical storm (2009)
- Damaged back up hardware (data loss)

Lack of Capacity:

- Because the system remained dormant (new staff could not be trained)

Mauritius - Spot Imagery 2006 (5m resolution)

Rodrigues - Quickbird Imagery 2006 (60 cm resolution)

Forest Lands on the Island of Mauritius

Lesson learnt/training Acquired

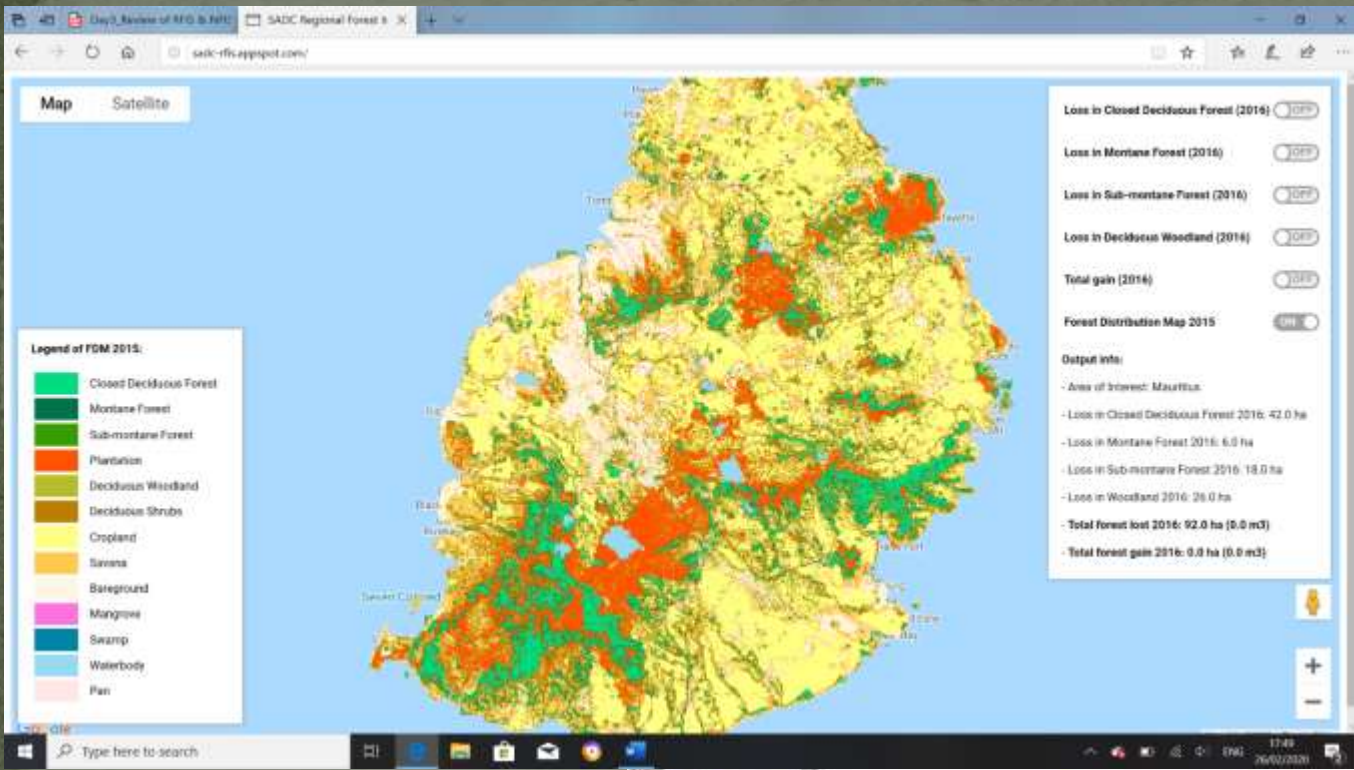

- Learnt how to use QGIS
- Developed skills/knowledge to acquire, process and analyze satellite imagery and also carry out ground truthing exercise for the monitoring of forest resources
- Knowhow of the open source database PostgreSQL and its interaction with QGIS.
- Learnt how to use Google Earth Engine for the monitoring of forest change
- Use of Python Script (including the use of PyQGIS and PyQt5) for the design, building, debugging and configuration of plugins for QGIS.
- Use of SADC Collect App for the collection of field data.

Way forward for FIS

- Provide training to Forest Officers in QGIS (already started) and PostgreSQL
- Ground truthing exercise for existing forest map (in progress since March 2019)
- Recruitment of additional Staff (E.g. GIS Officer, Forest Officers for a forest inventory and ground truthing)
- Acquisition of satellite imagery
- Creation of Forest Information Database in QGIS (NFIS)

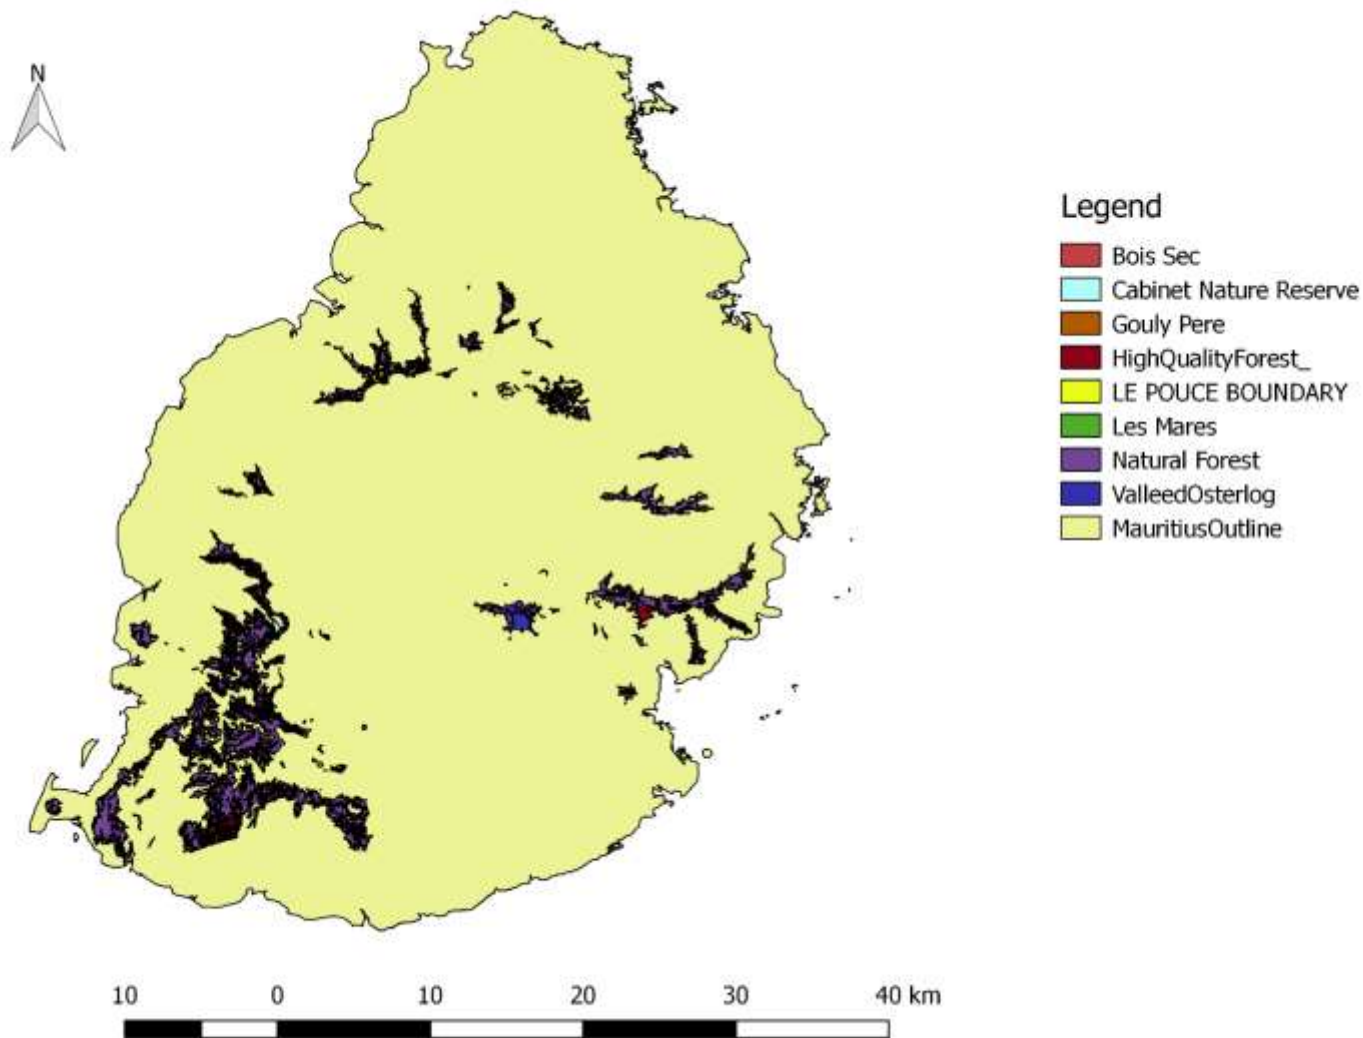

Way forward for FIS

- Use of QGIS database as a support for forest management and planning of forest operation
- Use of GEE for change detection
- Designing a country specific SADC Collect Form for the collection of field data and use of PC tablet for monitoring and ground truthing of forest areas.
- Updating the RFIS.

Natural and Native Forest

Natural and Native Forests

Forest Fire Management

Current Situation

- NO Forest fire database
- NO Forest maps
- Records of Forest fires are kept in fire occurrence report
- Existing approach for forest management is currently limited to: creation and management of firebreaks in fire prone areas

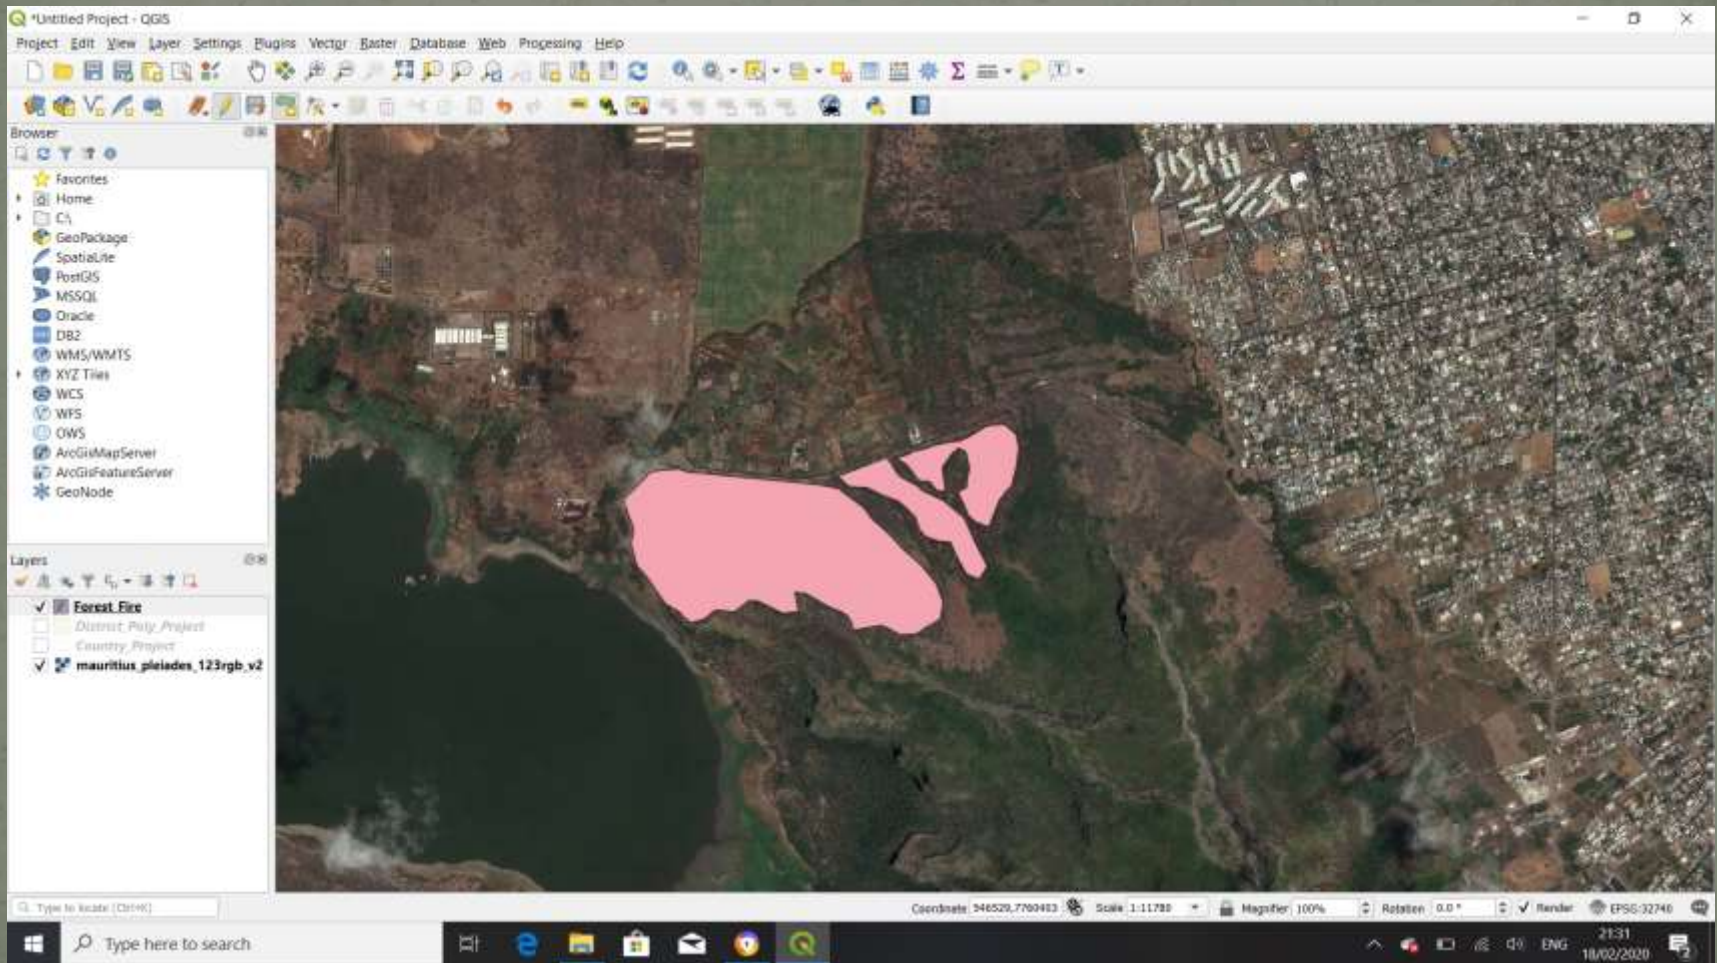

Fire on Signal Mountain

Lessons Learnt

- Acquisition of satellite imagery
- Use of Google Earth Engine to monitor forest fire
- Development and updating forest fire database and maps
- Use of PC tablet for monitoring and ground truthing of affected areas.

Mapping and Creating a Forest Fire database using Landsat and Pleiades Satellite imagery

Forest Fire at La Ferme

Fire Management

Fire Breaks - About 30 Km of fire breaks are opened annually on fire prone and sensitive areas (Ile D'Ambre, Ile aux Benitiers and Signal Mountain).

Way Forward for FFM

The knowledge acquired during the training will help the Forestry Service to:

- Map forest areas affected by forest fire/ and fire prone region.
- Create a forest fire database
- Better plan forest fire management/prevention measures.
- Monitor forest fire prone region

Way Forward for FFM

- The final guidelines will be circulated among the relevant stakeholders including planning authorities.
- The awareness and sensitization programme will be undertaken with all relevant institutions/authorities include Government Fire and Rescue Service as well as public at large.
- Preparation of awareness raising material in local context.
- Integration of recommendation of the regional guidelines in national policies and strategies relevant to climate change.

Thank You
